

Precisely as a Swiss clockwork

The components are closely connected and run like clockwork: Security Information and Event Management (SIEM), agileSI™ (iT-CUBE SYSTEMS) and SAP®. Through this innovative combination of security solutions we are able to close large security gaps in traditional IT-infrastructures.

Highest requirements for production security and quality assurance

The customer produces luxury goods and works with different precious materials in production. Commodities management and production rely on SAP® technology. Due to the material's and the product's worth, a specialized adapted solution is necessary. Therefore several processes were defined and integrated via applications into SAP®. The whole production process is completely monitored this way.

The customer-owned applications produce a huge amount of SAP®-data, which contribute to the continuous control and quality management of the production process. This data needed be analyzed in real-time to allow a quick reaction and an effective and automated surveillance.

Different third-party products were evaluated to find the ideal software solution. Even the development of an own SAP®-solution was discussed. Finally, the decision for agileSI™ was made because it is the ideal software for a SIEM-monitored SAP®.

agileSI™: The perfect symbiosis between SAP® and Splunk®

That way, actual threats to critical applications can be identified among more than ten thousand events. Thanks to agileSI™, SAP®-events, system settings and business data can also be integrated into SIEM-products, such as Splunk®. Now all data regarding security relevant areas within the SAP®-system can be extracted. Therefore, agileSI™ is capable of creating an extended and detailed status of the whole SAP®-operations. And it doesn't matter whether an external manipulation or carelessness were the reason for an alert – everything that could affect security will now be captured by the alarm system.

Security advantage for the inside & outside

agileSI™ is the first solution for a continuous and automated SAP® security monitoring in a central SIEM system also suitable for industrial businesses. It is the bridging technology which combines SIEM and SAP®.

As the result, a maximum of transparency is guaranteed – always. The gathered data is edited and clearly visualized and available only to those organizational divisions who have a need to know. Not everybody needs the same information. Even the priorities can vary for each individual case.

The most current data is always available: for the people in charge of the production lines, the production planners and department heads as well as the upper management. Individual dashboards and visualizations have been created within the log management solution to inform different areas of the organization in a need-oriented way. Therefore, it is made sure that the exact data can be found – no matter by whom it is required.

» agileSI™ closes the gap between IT security and SAP®. Big data analysis such as attack / fraud detection, security audits or security compliance – with agileSI™, this is an easy task inside a SIEM solution, within a few seconds. «
